

When you create a React Native project using `npx-create-expo-app`, a git repository is already created for you. You must link this local git repository to GitHub.

Steps:

Create a remote repository on GitHub. **Do not click Add a README file.**

Back on the command line, create a React Native project using `npx-create-expo-app` *app_name*

Go to the new app's root directory and issue this command:

```
git remote add origin <insert repository URL here>
```

This is an example:

```
git remote add origin https://github.com/kmaloneVillanova/RNProject3.git
```

Now push the files to GitHub with these two commands:

```
git branch -M main
```

```
git push -u origin main
```

Go to GitHub repository and refresh page. You will see your React Native project files.

Have your teammates clone this repository.

You can now add and edit files in the local repository and push to the remote repository like we did in the examples in class.
